National Electric Safety Month
Pool & Spa Safety

Electric shock drowning occurs when swimmers are exposed to electric currents in the water. In some cases, the shock itself is fatal because the person will suffocate when their diaphragm is paralyzed, while in others the electric current incapacitates the swimmer causing them to drown. The main cause of electric shock drownings is faulty electrical wiring that causes electric current to leak into the water.

HOW TO PREVENT ELECTRIC SHOCK DROWNING

1. **Locate and label** all power switches to pool, hot tub, and spa equipment and lighting.
2. **Make sure** all pools, hot tubs, and spas are at least **25 feet** from power lines.
3. **All wiring and repairs** should be performed by a **qualified electrician**.
4. **Have a qualified electrician inspect** your pool, spa, or hot tub **annually**.
5. **Install GFCIs**, which can prevent electrocution, on all receptacles within **20 feet** of water’s edge.

#### Sign Up for SmartHub
An easier way to manage your GHBLP electric bill. Through SmartHub you can:
- Access multiple accounts
- Update contact information
- Pay your bill in real time
- Set recurring payments
- Compare monthly bills

Visit [ghblp.org](http://ghblp.org) to set up your SmartHub Account.

**Get Plugged In!**

### Don't Let Summer Heat Up Your Utility Bill

- Seal cracks around the house with weather stripping or caulk to keep warm air out.
- Change the air filter on your cooling unit.
- Wash your outdoor AC unit and have your HVAC unit inspected.
- Clear the air vents throughout your house.
- Install a programmable thermostat. Leave it on a higher temperature when you are away, and set it to cool the house half an hour before you return home.
- Update your insulation to keep cool air in your home and warm air out.

### EARN CENTRAL AIR CONDITIONING REBATES when you purchase and install Energy Star® rated equipment.

- Incentive per 17 SEER unit: $150
- Incentive per 16 SEER unit: $100
- Incentive per 15 SEER unit: $75

Visit mienergysmart.com for your Rebate Application

### Comparing 2018 to 2017

The AVERAGE amount billed to each residential customer increased 6.2% year over year. This increase was due to an increase in average energy usage in 2018.

The AVERAGE energy usage of each residential customer increased 6.1% year over year. This increase was primarily due to warmer summer weather in 2018.

Adding cooling or heating degree days together for a whole month (or year) provides a way to compare a previous month’s (or previous year’s) heating and cooling demands to that of the current month (or current year).

### What is a Degree Day?

**Degree day** – Cold winter weather or summer heat can increase the cost of your utility bills. You can determine the weather impact by using a unit of measure called a Degree Day. A higher number of degree days will require more energy for cooling or heating your home or business.

### ACTUAL Residential Energy Use & Rate Comparison

#### January to December

<table>
<thead>
<tr>
<th>2018</th>

<tr>
<td>Number of Cooling Degree Days - Increased in 2018</td>
<td>61.4% above normal</td>
<td>8.8% above normal</td>
</tr>
<tr>
<td>Number of Heating Degree Days - Increased in 2018</td>
<td>1.8% below normal</td>
<td>10.2% below normal</td>
</tr>
</tbody>
</table>

In 2018, the total number of cooling degree days was 61.4% above the normal or average year.

**2 types of degree days** – Cooling and heating. Each compares the current day’s average temperature to a baseline standard of 65°F to determine the energy demands of cooling or heating your home or business. Days with an average temperature of 65°F have no cooling or heating degree days. Hot days are measured in cooling degree days. On a day with a mean temperature of 80°F, 15 cooling degree days would be recorded (80-65=15). Cold days are measured in heating degree days. For a day with a mean temperature of 40°F, 25 heating degree days would be recorded (65-40=25).
