Spring into Savings and Get Rebates with Energy Efficient Appliances and Equipment

Central Air Conditioning
Incentive per 17 SEER unit: $150
Incentive per 16 SEER unit: $100
Incentive per 15 SEER unit: $75

Mini-Split System
Incentive per 18 or higher SEER unit: $300

Energy Star® TV
Incentive per unit: $30

Energy Star® Air Purifier
Incentive per unit: $40

NEVER ENTER FLOOD WATERS

When floods happen, news reports often show homeowners and reporters standing in or rowing through flood waters. Flood waters can cover downed power lines or other electrical hazards, and the combination of water and electricity can cause shock or electrocution.

SAFETY REMINDERS

- Never enter flood waters, on foot or by any other means, even when you are wearing rubber boots, or are in boats or canoes
- Electrical hazards such as downed power lines could be lurking under standing water
- Do not enter a flooded basement if water is deep enough to cover outlets, appliances, electrical cords or wiring
- Do not touch electrical equipment such as wires, switches or fuses if you are wet, standing in water or on a damp surface
- Do not use electric yard tools if it is raining or the ground is wet

Comparing 2020 to 2019

The AVERAGE amount billed to each residential customer increased 7.4% year over year due to an increase in average energy usage in 2020. COVID-19 required many of us to work or attend school from home, increasing residential electric usage.

In 2020, the total number of cooling degree days was well above the normal or baseline standard leading to higher electric usage during the hot summer season.

What is a Degree Day?

Degree Day – Cold winter weather or summer heat can increase the cost of your utility bills. You can determine the weather impact by using a unit of measure called a degree day. A higher number of degree days will require more energy for cooling or heating your home or business.

2 Types of Degree Days –

Cooling and heating. Each compares the current day’s average temperature to a baseline standard of 65°F to determine the energy demands of cooling or heating your home or business.

Days with an average temperature of 65°F have no cooling or heating degree days. Hot days are measured in cooling degree days. On a day with a mean temperature of 80°F, 15 cooling degree days would be recorded (80-65-15). Cold days are measured in heating degree days. For a day with a mean temperature of 40°F, 25 heating degree days would be recorded (65-40-25).

Adding cooling or heating degree days together for a whole month (or year), provides a way to compare a previous month’s (or previous year’s) heating and cooling demands to that of the current month (or current year).
